

6. Kids With the Greatest Number of Candies There are n kids with candies. You are given an integer array `candies`, where each `candies[i]` represents the number of candies the i th kid has, and an integer `extraCandies`, denoting the number of extra candies that you have. Return a boolean array `result` of length n , where `result[i]` is `true` if, after giving the i th kid all the `extraCandies`, they will have the greatest number of candies among all the kids, or `false` otherwise. Note that multiple kids can have the greatest number of candies. Example 1: Input: `candies = [2,3,5,1,3]`, `extraCandies = 3` Output: `[true,true,true,false,true]` Explanation: If you give all `extraCandies` to: - Kid 1, they will have $2 + 3 = 5$ candies, which is the greatest among the kids. - Kid 2, they will have $3 + 3 = 6$ candies, which is the greatest among the kids. - Kid 3, they will have $5 + 3 = 8$ candies, which is the greatest among the kids. - Kid 4, they will have $1 + 3 = 4$ candies, which is not the greatest among the kids. - Kid 5, they will have $3 + 3 = 6$ candies, which is the greatest among the kids

PROGRAM:-

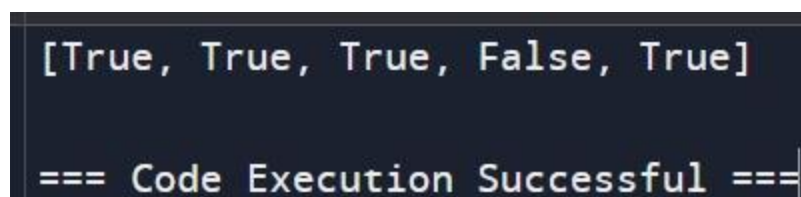

```
def kidsWithCandies(candies, extraCandies):
    max_candies = max(candies) # Find the current maximum number of candies
    result = []

    for candy in candies:
        if candy + extraCandies >= max_candies:
            result.append(True)
        else:
            result.append(False)

    return result

# Example usage
candies = [2, 3, 5, 1, 3]
extraCandies = 3
print(kidsWithCandies(candies, extraCandies)) # Output: [true, true, true, false, true]
```

OUTPUT:-

```
[True, True, True, False, True]
=== Code Execution Successful ===
```

TIME COMPLEXITY:- $O(n)$
